divisors other than 1 and itself.

Write a Python program that:

- Accepts an integer input from the user
- Checks whether the number is prime using appropriate control flow constructs
- Displays a suitable message indicating whether the number is prime or not

Ensure proper use of loops and conditional statements.

## Your Code

```
1 n=int(input())
2
3 if n <=1:
4     print("not prime")
5 else:
6     prime = True
7     for i in range(2,n):
8         if n % i == 0:
9             prime = False
10            break
11
12 if prime:
13     print("prime")
14 else:
15     print("not prime")
```

## Input

7

## Output

prime

- Accepts a number n from the user
  - Generates and displays the first n terms of the Fibonacci sequence
  - Uses looping constructs to compute the sequence
- Ensure the program handles cases where n is less than or equal to zero.

## Your Code

```
1 n = int(input())
2
3 a = 0
4 b = 1
5
6 if n <= 0:
7     print("invalid input")
8 else:
9     for i in range(n):
10         print(a)
11         a,b = b,a + b
```

## Input

5

## Output

0  
1  
1  
2  
3

- Accepts a string input from the user
  - Counts the number of vowels, consonants, digits, and special characters present in the string
  - Displays the count for each category
- Use appropriate string operations and control flow statements.

### Your Code

```
1 s = input()
2 v = c = d = sp = 0
3
4 for i in s:
5     if i.lower() in "aeiou":
6         v += 1
7     elif i.isalpha():
8         c += 1
9     elif i.isdigit():
10        d += 1
11 else:
12     sp += 1
13
14 print(v)
15 print(c)
16 print(d)
17 print(sp)
```

### Input

python@2026

### Output

```
1
5
4
1
```

```
if num % 2 == 0:  
    print("Even")  
else:  
    print("Odd")
```

## Your Code

```
1 num = int(input())  
2  
3  
4 if num % 2 == 0:  
5     print("Even")  
6 else:  
7     print("odd")
```

## Input

6

## Output

Even

Complete the program by filling in the blanks so that it correctly prints numbers from 1 to 10.

# Program to print numbers from 1 to 10

for i in \_\_\_\_\_:

print(\_\_\_\_\_)

Also explain how the range() function works in this context.

## Your Code

```
1 for i in range(1,11):  
2     print(i)
```

## Input

stdin input

## Output

```
1  
2  
3  
4  
5  
6
```
